**For Immediate Release  
June 23, 2003**

## **NEW 25 Year “Silver Service Life” for REGO® Regulators**

ECII, the manufacturer of RegO® Products, has, after a careful review, decided to make the following recommendation regarding the service life of RegO® regulators:

***In general, inspect regulators regularly as outlined in the RegO® Products regulator safety warning and replace as required per these recommendations. When all these recommendations are followed, the recommended service life of an ECII/RegO® regulator (except single stage) manufactured after 1995 is 25 years.***

RegO® has made this change after a review of the following issues:

- Changes in the 1995 edition of NFPA 58, which eliminated single stage regulation in permanent installations and increased downstream protection to 2 PSI.
- Participation of propane marketers in the “Gas Check” program.
- RegO® regulator design enhancements which have included:
  - Udyllite body and bonnet treatment and an enhanced painting process
  - Fully molded diaphragms, including a molded bead that seals between body and bonnet.
  - Buna “O”-ring seal between the body and inlet nipple
  - Enhancements to the spring casing screw, relief spring retainer and spring adjustment device.
  - Addition of multiple vent orientations
  - Addition of patented RegULock™
- A review of RegO® regulator field performance and product feedback since 1995.
